

UreaCoat™ Nitrogen Fertiliser Coating

Increase Urea efficiency and buffer against the harmful effects of concentrated Nitrogen in the soil with Ferti-UreaCoat.

An easy to apply liquid Carbon formulation that protects and prevents Urea from induced volatisation (conversion to ammonia gas) for up to 8 weeks. The moisture reactive carbon humate coating of UreaCoat readily dissolves in the presence of water permitting the Urea to convert and bond with the available humate in its ammonia and nitrate forms.

The Cation Exchange properties (CEC) of UreaCoat™ also acts as catalyst for bonding with other minerals, thereby preventing the leaching of other useful nutrition from the soil profile.

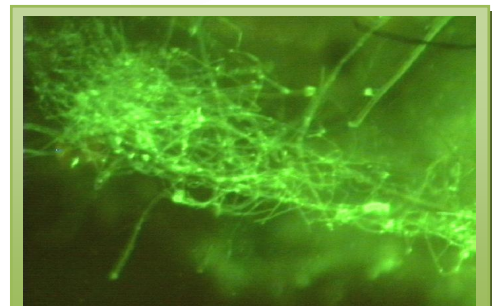

UreaCoat also contains micro-nutrients, trace elements, amino acids, humic and fulvic acids for optimal performance and additional nutrient application with Urea Nitrogen.

Application

- Apply inline to Auger, Conveyor, Mixer or Spray On and Blend
- 6 litres per tonne of Urea

Caution

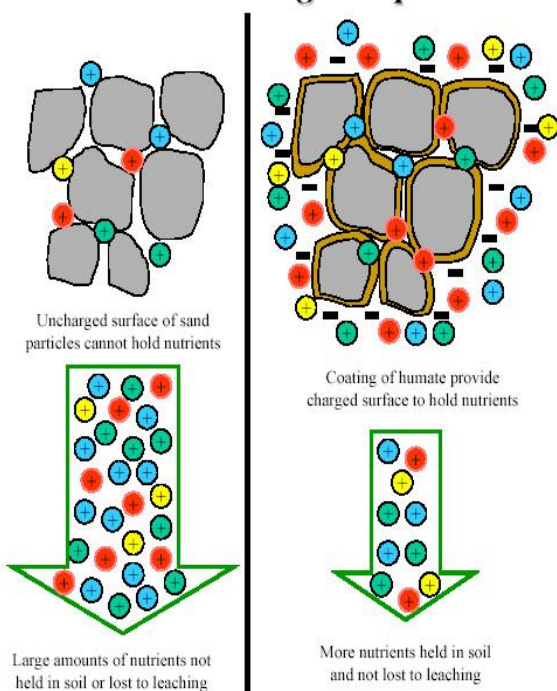

- High Alkaline (pH 10)
- Wear eye protection and avoid contact with Skin

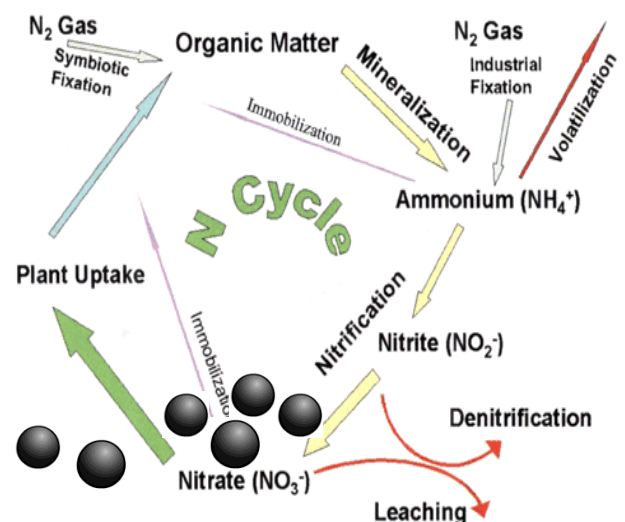

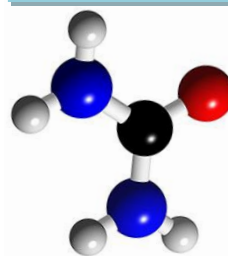

Beneficial Soil Microbes are well protected from a concentrated Nitrogen exposure with UreaCoat.

The soluble humate coating is a catalyst for improved aerobic soil conditions and also acts as a microbial stimulant

Cation Exchange Properties

Stabilises Urea for maximum conversion to usable Plant Nutrition

Prevent loss of Nitrogen and promote a far better soil microbial environment in one application.
